

Comparing Electromedicine Devices

Overview

There are four different kinds of electromedicine devices I will talk about in this article:

- 1) The Photon Devices (Photon Genie and Photon Genius)
- 2) The GB-4000 Devices (GB-4000 M.O.P.A. and GB-4000 SR-4)
- 3) The Bob Beck Devices
- 4) The Zappers

Each device has its place in natural medicine, but it is important to understand the benefits and limits of each device.

The Photon Devices

The Photon devices, the Photon Genie (\$3k) and Photon Genius (\$25), can be used by any cancer patient. However, it is important to note that neither device is a "cancer treatment" by itself. They are used along with a strong nutritional protocol which is designed based on a consultation which costs \$1,500.

The nutritional protocol is just as important as the Photon device as it identifies the "root cause" of the problem.

The Ed Skilling Institute describes the Photon Genius as a "Photon Genie on steroids." In other words, they both do the same basic things, but the Photon Genius does more things and is much more powerful at energizing cells, especially for weak cancer patients.

The Photon Genius is similar to a Quantum Pulse in some respects, but was designed for cancer patients and patients of certain other cell-energy diseases (e.g. Multiple Sclerosis, Parkinson's, etc.).

If you need a cell-energy device, and you cannot afford a Photon Genie or Photon Genius, and there is not a Photon Genius near you (the Ed Skilling Institute, www.edskilling.com, can tell you if there is one near you that you can access), then go to the: www.TheQuantumPulse.com website to see if there is a Quantum Pulse near you.

The Quantum Pulse is also a powerful cell-energy device, but does not have the same features as the Photon Genius, such as the infra-red. But there are a lot more Quantum Pulse devices, available for public use, than Photon Genius' devices available for public use.

While the Photon devices do kill large numbers of microbes, that is not what they were primarily designed to do. They were designed to energize cells and reduce inflammation and swelling.

The Photon Genius is **incredibly powerful** at energizing cells, reducing inflammation and reducing swelling. You "know" when you are standing or sitting in front of this device!!

The Photon Genie, while not as powerful, can be run 24 hours a day (it has an attachment that slides under your mattress to run all night long).

Energizing cells is a key feature of these devices. For example, suppose a person has a weak liver. If you energize the cells of the liver the "liver" itself will be energized. Why do I say this?

The reason is that our body is made up exclusively of cells. If you removed every cell from your body, there would be nothing left but a pool of blood and other liquids on the floor (along with dental amalgam and other metals put there by dentists and doctors). But even the blood would have cells in them.

There is really no such thing as an "organ," there is simply a collection of cells which are collectively called an "organ." To energize the individual cells is the same things as energizing the "organ."

The philosophy of the Ed Skiling Institute is to "balance" the organs, meaning energize all of the cells in the body. By energizing the cells in the body the organs are also energized and they are "balanced" because they all have the same energy level. By balancing the organs (in case one of them is weak) the immune system can quickly become supercharged.

In other words, if you energize all of the cells in the liver, the "liver" will be energized because the "liver" is nothing but the combination of its individual cells.

All people have cancer cells in their body. However, all people also have immune systems which routinely kill cancer cells.

When the balance between the immune system and the number of cancer cells becomes out of balance, the cancer cells may win the battle and the person may be diagnosed with cancer.

So what can weaken the immune system? A weak liver or weak kidney, for example, can weaken key parts of the immune system.

By energizing all of the cells in the body, the cells are balanced, the organs are balanced and the immune system can be energized.

Thus, for weak cancer patients, patients who have dangerous tumors, etc. by energizing the cells the "root cause" of the cancer is addressed.

While the Photon devices do not DIRECTLY deal with the cancer cells they do deal directly with the "root cause" of the cancer which is usually weak cells.

Weak cells are also what kill many cancer patients.

The devices also help keep a cancer patient from becoming weak.

However, the nutritional protocol that is available with the Photon device (the consultation is \$1,500 and a more extensive consultation is available for extra charge with Dr. Hayle Aldren, M.D.) DOES kill microbes in the liver and throughout the bloodstream. This also energizes the immune system.

The consultation is required because it leads to half of the total protocol.

Thus, the Photon protocols, with the nutritional protocol, do kill many microbes in the body, balances the organs and thus quickly supercharges the immune system. The immune system can then take care of the cancer.

Thus these protocols are energy balancing (at the cellular level), immune building and they do kill many microbes in the body.

But remember that the nutritional part of this protocol is equally important with the electromedicine part and that the Photon devices, by themselves, are not a complete cancer treatment.

The GB-4000 Devices (i.e. High RF Frequency Devices)

The GB-4000 devices are designed to do one primary job - kill microbes.

However, they do not just kill microbes in the bloodstream and in other places in the body (such as Lyme Disease or Hepatitis C), they also kill microbes **INSIDE** the cancer cells.

If you read the "What Caused Cancer" article, linked to on the left side-bar, you know that cancer is caused by microbes which are **inside** the cancer cells.

The GB-4000 devices use a **carrier wave** designed to get the microbe-killing frequencies inside the cancer cells to kill the microbes inside the cancer cells. This allows the cancer cells to **revert into normal cells** because nothing is blocking the production of ATP energy when the microbes are dead.

The carrier wave is actually designed to get the frequencies all the way through the body, including through the bones. But since the body is made up of cells, which each have cell membranes, by getting the frequencies all the way through the body (including the bones) the signals obviously penetrate the cell membranes and the microbes inside the cancer cells are killed.

When these microbes are killed, **the cancer cells revert into normal cells**.

The technology for the GB-4000 devices was discovered in the 1930s, by Dr. Royal Rife, a microbiologist, but his research was shut down by the FDA and AMA which did not like people curing cancer.

In theory, this device could cure cancer in one day. So why doesn't it cure cancer in one day? First of all, the result of using this much power would be unpredictable and could be very dangerous to the patient for several reasons.

But one reason it would definitely be dangerous is Herxheimer's. If you killed every microbe in the body in one day the person could die from the Herxheimer's reaction (or they will wish they were dead!!).

I know of two cases where cancer patients got such a severe case of Herxheimer's reaction (because they did not "build-up" properly) that they refused to use the electromedicine device again.

This is why the instructions (see my article on the "High RF Frequency Protocol" for an email address to get the instructions and technical support) always come with a "build-up" where the power of the device starts out very low and the power is slowly increased for a few days before it gets to full power. But even at full power it will not kill every microbe in one day. There are various reasons for this safety feature.

The GB-4000 devices use square waves, but it uses a specific square wave for each specific microbe, because each microbe has its own **resonance frequency** (i.e. the frequency at which it bursts, much like an opera singer can break a crystal glass at the right resonant frequency). Fortunately the frequency of the cancer microbe is well known.

Like the Photon devices, the GB-4000 devices always come with a nutritional protocol. Cancer patients always have a lot more problems than just their cancer cells, especially if they have had chemotherapy and radiation.

Many cancer patients have died without a single cancer cell in their body due to the damage to healthy cells by chemotherapy and radiation, thus nutrition is always critical.

While the GB-4000 does have energizing frequencies (page 15 of the current manual), the Photon device does a far better job at energizing cells and dealing with swelling and inflammation. Likewise, while the Photon device does kill microbes (especially with the nutritional part), the GB-4000 is far better at killing microbes.

The choice depends on the situation.

A person who can afford it, can use both devices as they do not conflict with each other.

The Bob Beck Protocol

The Bob Beck Protocol is a very inexpensive protocol that is also designed to kill microbes. One of the four parts of the protocol (the Blood Purifier or Silver Pulser) kills microbes in the bloodstream (actually it "attenuates" the microbes so they cannot breed, thus they simply die without reproducing) and the Magnetic Pulser is designed to attenuate microbes in the lymph system.

The colloidal silver and ozonated water are designed to actually kill microbes in the bloodstream, though the newer product LIPH is probably better than most colloidal silver products at killing microbes and it is a lot cheaper.

By attenuating or killing the microbes in the bloodstream the immune system is supercharged and the immune system takes care of the cancer cells.

But the way the Bob Beck protocol works (unlike the Photon devices) it is very slow at building the immune system. It is not a very effective way to treat cancer because most cancer patients these days have very weak immune systems, damaged by chemotherapy and radiation. And the Bob Beck protocol does not energize cells.

The Photon devices build the immune system much more quickly and also energize the individual cells and organs, etc. Likewise, the GB-4000 devices clean the body of microbes much more quickly than the Bob Beck protocol.

However, a newly diagnosed patient, with a very slow growing cancer, which has not spread very much, could very easily cure their cancer using nothing but the Bob Beck Protocol. This has been done many times.

A liver flush, however, should always be used if the Bob Beck Protocol is the main cancer treatment as it does not kill the microbes in the liver, and I do not know if the Magnetic Pulser is powerful enough to kill the liver flukes.

But the Bob Beck Protocol can actually benefit even very advanced cancer patients by helping the main electromedicine protocol quickly get rid of microbes in the bloodstream!! This is why you will frequently see this protocol mentioned on this website. The sooner these microbes are gone, the quicker the immune system can be restored.

The Zappers (e.g. Hulda Clark Zapper)

Like the Bob Beck protocols, the zappers are designed to get rid of microbes in the bloodstream, but the approach is different.

By the way, the Hulda Clark protocol, which includes a zapper, also includes specific herbs to do liver flushes.

The zappers typically go, for example, from the wrist to the ankle, and will kill microbes in this path.

If you could visualize what an electrical current looks like, when it goes from point A to point B, it would look like a football. Thus, inside this "football" of electrical current it can kill microbes.

But also remember, as far as the bones are concerned, that electricity always follows the "path of least resistance," thus the football analogy is not always accurate.

If you place the electrodes correctly (such as from right wrist to left ankle) you can kill many of the microbes in the liver. The liver is a safe haven for microbes and the mycotoxins (i.e. waste products) of these microbes do a massive amount of damage in the body by themselves.

There are many different opinions about which square-wave frequencies actually will kill any type of microbe in the body.

The Bob Beck Protocol uses 4 Hz square-wave.

I have seen many different opinions about other frequencies. And to be honest, I don't know which square-wave frequencies really work, except that I do know that **1 Hz** and **4 Hz** square wave devices do kill all types of microbes. Higher frequencies may also kill all types of microbes.

Final Comments

First of all, let me state that the vendors of electromedicine devices have to be very careful about making "medical claims" about their devices. This is especially true of Sota Instruments in Canada. So if you ask a straight question, you may not get a straight answer because they have no idea if you are who you say you are.

There is a man sitting in federal prison for 140 years for making medical claims about his electromedicine device.

The **Bob Beck** and **Zappers** *cannot* be used by people currently on chemotherapy or other strong drugs or most time-release drugs.

The Photon and GB-4000 devices **can** be used by anyone, even those on chemotherapy.

Every cancer patient should have a combination of nutritional and/or electromedicine protocols to help clean the blood, liver, etc. of microbes and hopefully energize cells, when needed.

Microbes are not only what cause cancer, they also steal energy from the cells, intercept nutrients, excrete mycotoxins (which are highly acidic and cancer cells thrive in an acidic environment), weaken the immune system, etc.

Nutritional protocols that kill microbes include organic sulfur, colloidal silver, LIPH, oxygen protocols (e.g. hydrogen peroxide and ozone), etc.

With rare exceptions, electromedicine devices are supplemental protocols for those who can afford them.

The Photon devices are always a supplemental protocol for cancer patients, but they can be a life-saving supplemental protocol in many situations.

See the "liver cleanse" for nutritional protocols that kill the microbes and flukes in the liver.
